Abstract

This document is the official demo for the Lightweight Book theme. This demo introduces the design goals, command interface, document structure, and common writing components with runnable examples.

Preface

If you are new to this theme, read this file from top to bottom once, then reuse the code blocks as a starter template. The class already bundles heading style, color system, theorem setup, callout boxes, and front-matter pages.

Theme Overview

The original section-style experiment has evolved into a full class. It now controls the cover, typography, chapter and section hierarchy, theorem blocks, utility callouts, and metadata output in a single interface.

Lightweight Book provides a modern class for books and reports.

1.1 What this theme gives you

Lightweight Book is designed for notes, technical reports, and compact books. It reduces repeated preamble code and keeps visual style consistent across files.

Summary

Lightweight Book offers a clean writing experience with modern defaults and reusable components.

Table 1.1: Core capabilities of Lightweight Book

Capability	What it does
Cover metadata commands	Generates a modern title page and fills PDF metadata fields.
Front-matter environments	Adds abstract, preface, acknowledgements, and dedication pages with TOC support.
Section and chapter style	Applies a consistent heading hierarchy and visual identity.
Math and theorem setup	Provides theorem-like environments with chapter-based numbering.
Callout and code blocks	Includes reusable summary, tip, warning, example, and listing styles.

1.2 Compile requirements

Tip

Compile with `XeLaTeX`. The class depends on `fontspec` and `ctexbook`.

Warning

Keep the `fonts/` folder beside `lightweightbook.cls` unless you customize font paths.

How to Start a New Document

2.1 Minimal template

Copy the snippet below into a new `.tex` file to start quickly.

```
\documentclass[english]{lightweightbook}

\booktitle{My Lightweight Book Notes}
\booksubtitle{Optional subtitle}
\bookauthor{Author Name}
\bookpublisher{Organization}
\bookedition{v1.0}
\bookdate{March 2026}
\booktagline{Optional short description}

\begin{document}
    \frontmatter
    \maketitle
    \printbookcontents

    \mainmatter

    \chapter{Introduction}
    Your content starts here.

    \backmatter
\end{document}

```

2.2 Metadata command reference

Table 2.1: Cover and metadata commands

Command	Description
`\booktitle{...}`	Main title shown on cover and used in PDF title metadata.
`\booksubtitle{...}`	Optional subtitle on cover.
`\bookauthor{...}`	Author line on cover and PDF author metadata.
`\bookpublisher{...}`	Publisher or affiliation text block.
`\bookedition{...}`	Optional edition or release label.
`\bookdate{...}`	Date text on cover.
`\booktagline{...}`	Short theme or subject line; also used for PDF subject metadata.
`\bookcoverimage{...}`	Optional image path for cover artwork overlay.

Detailed Feature Demonstration

3.1 Front matter helpers

The class includes dedicated environments for common publishing sections. In a real project, these typically appear in front matter or back matter.

```
\begin{bookabstract}
    Brief project summary.
\end{bookabstract}

\begin{preface}
    Context, audience, and scope.
\end{preface}

\begin{acknowledgements}
    Credits and thanks.
\end{acknowledgements}

```

3.2 Theorem environments

Definition 3.1. A reusable document class is a stable interface that separates content from presentation.

Theorem 3.2. *Centralizing layout in one class file improves consistency and lowers maintenance cost.*

Proof. When style commands are declared once in the class, documents avoid duplicated preambles. Future visual changes are made in one location and propagate to all documents. □

Example

Use `theorem`, `lemma`, `proposition`, `corollary`, `definition`, `example`, and `remark` directly.

3.3 Callout boxes

Summary

`summarybox` is ideal for key takeaways at the end of a section.

Tip

`tipbox` works well for writing and formatting guidance.

Warning

`warningbox` highlights constraints and migration notes.

3.4 Figure and graphics style

The class already loads TikZ, so diagrams can be added directly.

Recommended Project Layout

4.1 Suggested file organization

For larger projects, keep content modular.

```
project/
|- lightweightbook.cls
|- fonts/
|- main.tex
|- chapters/
|  |- 01-introduction.tex
|  |- 02-methods.tex
|  |- 03-results.tex
|- figures/
|- references.bib

```

This demo serves as both a showcase and a usage reference for Lightweight Book. Keep it as a baseline when adding new components to the class.
